Homework assignment

- A server sends 1024 Mb of data to a client over a 16.4 Mbps link with 2.5% of packet loss. The server sends the data in packets of 8 Mb and after sending a packet awaits to receive an acknowledgment packet of 8 bytes from the client before sending the next packet. If it takes 10 minutes to complete the transfer of data, determine the latency of the link.
- Explain the logic behind the phrase:
 - "You can buy more bandwidth, but you cannot buy less delay." Exemplify and motivate your answer.
- Compare Datagram to the Virtual Circuit networks with respect to:
 - circuit setup; addressing scheme; routing; router failure; Quality of Service;

03/20/25

Procedimiento

Número de paquetes = 1240/8 = 128

Tiempo de transmisión = 8/16.4 = 0.49

Delay = 1 (600 - Tiempo de transmición) = 2.045

- Velocidad de enlace: 16.4 Mbps
- Tiempo de transferencia: 600 s
- · El ancho de banda se puede aumentar con intraestructura, mientras que el delay es limitado por la distancia física

y no se puede reducir.

- Virtual Circuit Dotagram
- No requiere Requiere Circuito
- Se usa un VC ID Se envia por completo Direccionamiento
- Se sique un camino Enrutamiento Individual por paquete Calidad
 - "best effort" Reserva recursos

Homework assignment (cnt'd)

Calculate the total delay to transfer a 10 Mb file from the host 1 to the host 2 (from the beginning until the host 2 receives the last bit of the file) using circuit switching, message switching and datagram switching networks. Datagram size is 75 kb. The following is known:

The distance between the two hosts is 2000 km.

There are 3 routers (nodes) at the same distance in between the hosts.

Propagation speed is 200 000 km/s.

Transmission bandwidth is 1 Mbps.

Node processing delay is 100 ms.

Neglect processing delays in hosts.

Comment on the obtained results.

03/20/25

Distancia: 2000 Km

Enlaces: 4

Velocidad: 200 000

Ancho de banca: 1 Mbps

Retraso: 100 ms

Tamaño datagrama: 75 Kb

Procedimiento

Delay = 3.0, 1=0,35

Transmisión de archivo = 10000 000/1000 000 = 105

Propagación: 2000/200 000 = 0,015

Connutación de circuitos=10.31s

Conmutación de monsajes = 10,31s.4=41

Connutación de diagramas

Número de datagramas: 10Mb/75 Kb = 134

Tiempo de transmisión: 75 Kb/1Mbps = 0.073

Propagación por enlacen: 500/200 000 = 0.00255

(00775+01)4=0.615

Connutación de dagramas = 0.61 + (134-1). 0.1775 = 24,225
